CallGuard AI

FOR CONTACT CENTERS, BPOS & FIELD SALES

Every conversation. Every channel. Scored in real time.

Stop sampling 1% of calls and hoping the rest are fine. CallGuard AI transcribes, scores and coaches every sales conversation — phone, dialer or doorstep — live as it happens, and after the fact. AI that learns from your compliance team.

THE PROBLEM

You're flying blind on 99% of your calls

Most contact centers QA between 1% and 3% of calls manually. The other 97% are invisible — and the ones you do listen to take a supervisor 15 to 30 minutes each. There's a smarter way.

1–3%

CALLS QA'D TODAY

Industry average for traditional human-only QA programmes

25 min

PER CALL REVIEW

Average supervisor time per scored call (listen + score + notes)

£60k+

ANNUAL COST PER QA

Loaded cost of one full-time QA analyst in the UK

THE STATUS QUO

- ✕ Tiny random sample — bad calls slip through
- ✕ Inconsistent scoring between supervisors
- ✕ Coaching arrives weeks after the call
- ✕ Compliance breaches found in audits, not in real time
- ✕ QA team capacity caps how much you can grow

WITH CALLGUARD

- ✓ 100% of calls transcribed and scored automatically
- ✓ Same scorecard, every call, no scorer drift
- ✓ Coaching draft ready before the agent's next shift
- ✓ Real-time alerts the moment a critical call fails
- ✓ Capacity scales without hiring more QA staff

HOW IT WORKS

Calls in. Insights out. Live or after the fact.

CallGuard sits alongside your existing dialer, telephony stack or field-sales app. Stream audio live as the call is happening, push recordings after the fact, or embed our SDK directly in your rep's mobile app. Either way: transcript, score, breaches, coaching — all surfaced inside our dashboard or fed back into your tooling via webhook and API.

1

Ingest — live or batch

Drag-and-drop, REST API, SFTP/S3 sync for recordings; **live WebSocket streaming** from your Twilio, AWS Connect, Vonage or custom dialer; or our **mobile SDK** embedded in your field sales app. WAV, MP3, OGG, WebM, M4A, µ-law, Opus all supported. Encrypted at rest with AES-256-GCM.

2

Score — as it happens

Deepgram transcribes live with speaker separation. Claude scores against your scorecard, factoring in your firm's knowledge base, prior corrections and exemplar calls. Mid-call breach detection runs every 30 seconds on the rolling transcript.

3

Act — before the call ends

Critical breaches fire instantly to email, Slack, or your supervisor's phone — and stream back via signed webhooks to your dialer or CRM. Pass/fail per criterion, weighted overall score, evidence quotes and agent coaching draft are ready the moment the call ends.

Scorecards built for any vertical

Build your scorecard from scratch in our editor or upload your existing CSV. Every item is configurable: pass/fail, 1–5 scale, 1–10 scale, weighted critically, severity-tagged.

Sales & service scorecards

Greeting, identity check, empathy markers, value pitch, objection handling, no-pressure language, consent capture, summary close.

Compliance scorecards

TPS / DNC, recording disclosure, mini-Miranda, GDPR / CCPA references, vulnerable customer screening, multi-tenant per-client scorecards for BPOs.

PLATFORM FEATURES

Everything your QA, ops and compliance leads actually need.

Built for production contact centers from day one. Not a notebook demo — a working multi-tenant SaaS your team logs into Monday morning.

High-accuracy transcription

Deepgram Nova-3 with keyterm boost for product names and accents. AI-cleanup pass to fix dialer artefacts and confused speakers.

Real-time alerts

Trigger rules on low scores, critical breaches, or specific phrases. Send to email, Slack channels, or in-app notification bell.

Live dashboards

Pass rate, score trend, breach heatmap, top failing scorecard items, agent leaderboard, time-of-day performance.

AI agent coaching

Per-call coaching draft with strengths, improvements, and next actions. Builds on prior coaching to that same agent.

Breach register

Every critical fail logged with severity, status workflow, agent assignment, and audit trail for compliance reviews.

Agent risk profiles

Heatmap each agent by breach pattern. Spot the ones who need coaching this week vs the stars worth promoting.

Per-tenant AI learning

Supervisors correct AI scores; corrections become few-shot examples that calibrate scoring to your firm's interpretation.

Exemplar library

Mark gold-standard calls. The AI uses them as a reference bar when scoring future calls — your good looks like your good.

Knowledge base injection

Upload your QA manuals, product cheatsheets, and policy PDFs. Scoring engine reads them and applies firm-specific context.

Customer share links

Send signed read-only links of a scored call to clients (BPO use case) — no login needed, full PII redaction options.

Encryption at rest

AES-256-GCM on all uploaded audio and transcripts. JWT auth, signed URLs, role-based access control.

API + SFTP ingestion

REST API with API keys, or polled SFTP sources for legacy dialers. Webhooks back to your CRM when calls are scored.

Plays nicely with the stack you already have

Genesys · Five9 · Twilio Flex · AWS Connect · Avaya · 8x8 · RingCentral · Talkdesk · NICE CXone · Salesforce Service Cloud · HubSpot · Zendesk · Slack · Microsoft Teams · Custom dialers via SFTP

LIVE & EMBEDDED

Score the call while it's still happening.

Most QA tools wait until a call ends. CallGuard streams audio live from your dialer or rep's pocket, transcribes in real time, and flags critical compliance breaches mid-call — before the rep finishes the pitch. Live transcript builds as it's spoken; every 30 seconds the AI reviews what's been said and emits high-confidence breach alerts via signed webhook to your CRM, dialer or supervisor's screen.

Three integration paths, one engine

Dialer streaming

First-class adapters for Twilio Media Streams and AWS Connect Voice Streams. Vonage, Plivo, Telnyx and any WebRTC dialer supported via our generic protocol. Older Genesys / Avaya stacks via SIPREC.

Mobile SDK

iOS Swift Package and Android Kotlin library. Five-method public API: configure, start session, end, on-breach, on-transcript. Handles mic permission, consent capture, Opus encoding, offline buffering and battery throttling.

Browser / web SDK

Drop into any web app — agent desktops, virtual call panels, customer-facing forms. Same WebSocket protocol as mobile. Useful for partners who want CallGuard inside their existing browser-based agent UI.

Mid-call breach webhooks

HMAC-SHA256 signed POST to your endpoint within 30 seconds of detection. Retry with exponential backoff. Full audit log of every delivery attempt visible in your dashboard.

Confidence-gated alerts

Live scoring only emits a breach when the AI is >75% confident the criterion has already been broken — not "might be" or "could happen." Designed to avoid alert fatigue from day one.

Consent capture, baked in

SDK plays a recording-disclosure prompt at session start and captures the customer's verbal "yes" before the stream proceeds. GDPR Article 6 and UK Consumer Contracts Regs covered without writing your own logic.

What's coming next: live in-call coaching

Beyond breach detection: a real-time AI coach that whispers context-aware nudges to the rep mid-call ("ask about capacity for loss now," "soften the close") via earpiece, on-screen prompt or haptic pulse. Personalised to each rep using your firm's prior coaching memory.

USE CASES

Built for any regulated sales conversation.

From 50-seat boutique BPOs to 5,000-seat global outsourcers — and from inbound customer support to doorstep field sales. The pain is the same: too many conversations, not enough QA capacity, regulators tightening, and clients demanding more visibility.

CUSTOMER SUPPORT CONTACT CENTER

CSAT root-cause, not just CSAT scores

Score every inbound call against an empathy plus first-call-resolution scorecard. Surface the small share of agents driving the bulk of low-CSAT outcomes — coach them in week one, not month three.

OUTBOUND SALES / LEAD GEN

Catch urgency-language breaches before regulators do

Live streaming from the dialer means no-pressure-language and consent-capture failures alert the floor manager mid-call, not after the customer has hung up and complained. TPS and TCPA scoring on 100% of attempts.

FIELD SALES / D2D

Doorstep visits, scored from a phone in a pocket

Mobile SDK embedded in the rep's app records the visit, captures consent, and streams to CallGuard live. GPS metadata for anti-fraud, mid-visit breach alerts, and full-quality scoring + coaching the moment the rep walks back to their car.

MULTI-TENANT BPO

One platform, many client scorecards, zero spreadsheets

Each client gets its own scorecard, knowledge base and reporting. Customer share links let each client log into a scoped portal to see their own QA — replaces a multi-person reporting team and gives clients the visibility they're paying for.

DEBT COLLECTIONS

Mini-Miranda compliance scored on every single call

FDCPA, CONC and Ofcom collections rules are non-negotiable. CallGuard scores mini-Miranda, no-call-windows, profanity, and threats on 100% of attempts — and fires live alerts on critical breaches before the call ends.

HEALTHCARE PATIENT SERVICES

HIPAA-aware empathy scoring at hospital-network scale

Patient appointment and billing call centers using CallGuard to score empathy markers, policy explanation clarity and PHI handling. PII redaction on transcripts, encryption at rest, signed URLs only, BAA available.

NEXT STEPS

Sign up at 9am. 100 calls scored before lunch.

No 90-day pilot. No solution architects. No integration project. Each call is transcribed and scored in under a minute. Drag in 100 calls, walk to the kitchen, come back to a fully populated dashboard with breaches, coaching and trends.

1

Sign up & load your scorecard

Create an account, upload your existing scorecard CSV, drop in any QA manuals or product cheatsheets to the knowledge base. About 5 minutes.

2

Bring in your calls — any way you like

Upload recordings from your desktop, push via API, connect SFTP / S3, point your Twilio or AWS Connect dialer at our WebSocket, or embed our mobile SDK in your field app. Score 10 calls or 10,000 in parallel.

3

Read your dashboard

Pass rate, breach register, agent leaderboard, coaching drafts — all populated. Correct any AI scores you disagree with. The AI calibrates to your bar from the next call onwards.

See your floor scored — today.

No sales call required to start. Sign up, drag your calls in or wire up your dialer, see the results before close of play. If you want a guided walkthrough we'll give you 30 minutes with a real engineer — not a BDR.
